# Case Study: Packaging Plant

Before modeling, understand the use case thoroughly: the assets, processes, and the flow of information through the system.

- **System Layout:** Conveyor belt with two stations
  - Station 1: Packing
  - Station 2: Labeling
- **Workforce:** Workers assigned to each station
- **Environment:** HVAC with sensors to control temperature and humidity (prevent spoilage)

# What are Digital Twins?

©SS

Digital Twins: *virtual (digital) replicas of their physical counterparts*

- 📄 Represent? State/behavior of assets
- 🔄 Operate? Utilize real-time/historical data and continuously synchronize
- ⚙️ Think? Learning-based methods
- 🎯 Objective? Prediction, Optimization, Risk assessment, etc.

# Why Do We Need a Digital Twin?

## ■ Objective I: Resource Optimization

- Challenge: How many workers are needed at each station?
- DT: Simulates workforce to find the optimal balance.

## ■ Objective II: Food Safety

- Challenge: How to keep temperature and humidity within safe limits?
- DT: Uses sensor data to predict risks and simulate failures.

## ■ Objective III: Throughput Analysis

- Challenge: Where are bottlenecks, and how do they affect flow?
- DT: Identifies bottlenecks, simulates fixes, and prevents delays.

✔ Directly implementing these scenarios on the shop floor can be costly (idle resources), slow production, and disrupt operations.

Digital Twins involve substantial constraints in design, operation, maintenance, and cybersecurity.

# Objectives of Digital Twins

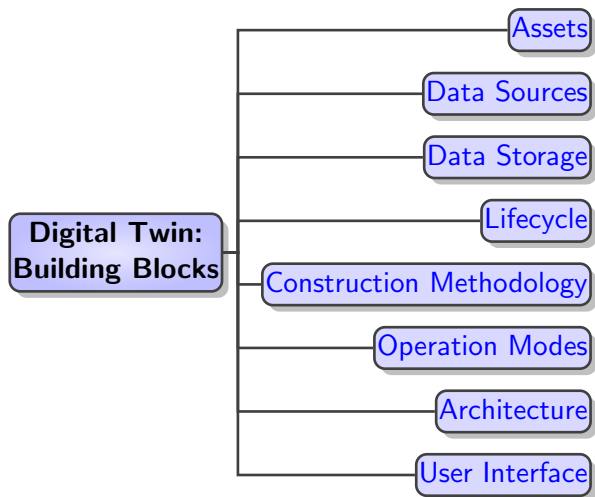

©SS

**i** Clear objectives guide DT scope, modeling, and implementation to deliver meaningful impact.

# Building Blocks of Digital Twin

©SS

Use case and Objective

# Digital Twin Building Blocks: Assets

©SS

## Example:

- **Tangible:** Conveyor belt, packing and labeling stations, sensors  
(Objective: Resource optimization, Food safety)
- **Intangible:** Packaging process workflow, worker tasks, station coordination  
(Objective: Throughput/Bottleneck analysis)

⚙️ Assets can be modeled individually (unit-level) or as part of the full process (process-level)

Model only what matters; full system replication is unnecessary.

# Digital Twin Building Blocks: Data Sources

©SS

🕒 Build DT after CPS (CPS-first), before CPS (DT-first), or Simultaneous

- **Real-time data:** temperature/humidity sensors, conveyor speed, packing counts
- **Historical data:** throughput records, environmental conditions, maintenance logs
- **Synthetic data:** workforce allocation or HVAC failures
- **Optional data:** supplier information, inventory levels, energy costs

# Digital Twin Building Blocks: Lifecycle

©SS

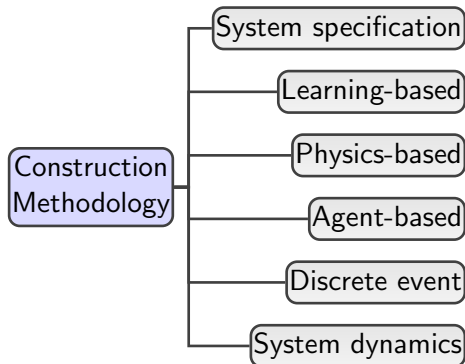

**⚠** Pre-requisite: Understand the case study, Analyze objectives, Identify critical assets, Define Tiers (Replication, Simulation) [10]

**i** Digital twin design: Thinking capability + Visualization

◀ Building Blocks

# Digital Twin Building Blocks: Construction Methodology

©SS

Other terms: geometry, physics, behavior, and rule [12].

- 🌀 Depends on objective, underlying use case, and simulation tools
- 📍 Multi-Method Modeling/Hybrid Modeling

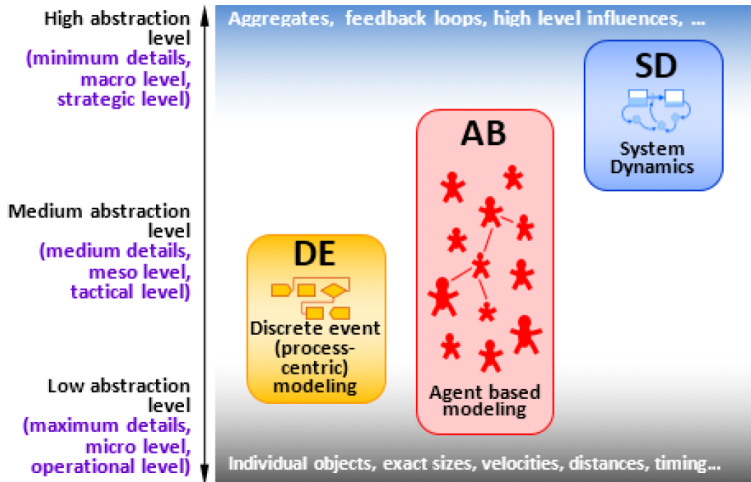

◀ Building Blocks

# Digital Twin Building Blocks: Construction Methodology

- System specification: Uses system architecture and control logic.  
Example: Conveyor, packing/ labeling stations, HVAC system design.
- Physics-based: Uses physics laws. Example: Monitor temperature and humidity.
- Learning-based: Uses data-driven models. Example: Predict workforce allocation using historical data.
- Agent-based: Models individual entities and their interactions.  
Example: Worker movements between packing and labeling stations.
- Discrete event: Process-centric sequential operations. Example: Product flow through stations with queue dynamics.
- System dynamics: Focuses on feedback and system-wide trends.  
Example: Overall packaging throughput and resource usage trends.

**Note:** [The Art of Process-Centric Modeling with AnyLogic](#)

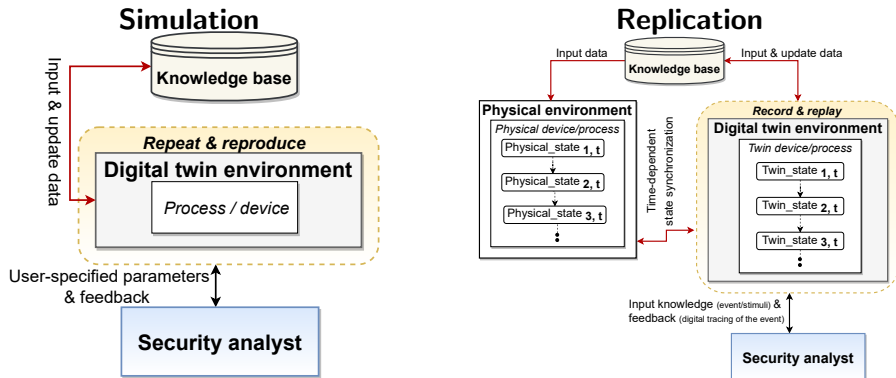

# Digital Twin Building Blocks: Construction Methodology

# Digital Twin Building Blocks: Operation Modes

©SS

◀ Building Blocks

# Digital Twin Building Blocks: Operation Modes

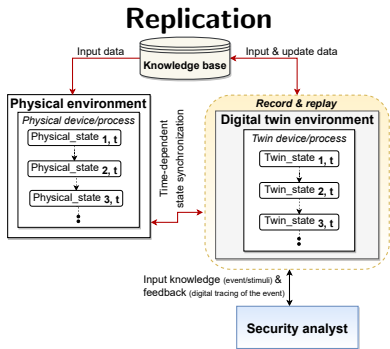

Simulation mode operates in an isolated virtual environment without directly connecting to the real system.

- ✔ Supports reproducible and reconfigurable experimentation
- ✘ Based on assumptions, and can oversimplify reality if not validated.

? Is simulation mode required for our objective?

# Digital Twin Building Blocks: Operation Modes

©SS

Replication mode operates by maintaining a continuous and synchronized connection to the live systems.

- ✔ Reflects the real-time behavior of the system with high accuracy and supports autonomous decision-making.
- ✔ Enables self-healing and self-adaptive digital twins through continuous synchronization with the live system.
- ✘ Requires significant resources due to high-fidelity demands
- ?: Is replication mode required for our objective?

# Simulation Mode vs. Replication Mode: When to choose what?

Aspect	Questions	Tier-I: replication Selected option(s)	Tier-II: simulation Selected option(s)
Security	How significant are critical components to core system functionality?	high, medium	low
	Do critical components have access to sensitive information?	yes	no
	Do risk assessment results directly influence categorization?	yes	no
	Are critical components susceptible to threats, including implications for human and environmental safety?	yes	no
Operational	What are the recovery costs and complexities of critical components?	high, medium	low
	Which critical components require: (i) state/time-dependent digital-physical synchronization or disjointed from physical, (ii) variable fidelity or sufficient fidelity, and (iii) continuous instances or reproducible instances?	state/time-dependent digital-physical synchronization, variable (preferably high) fidelity, continuous instances	disjointed from physical, sufficient fidelity, reproducible instances
	What is the preferred degree of autonomy?	human-on-the-loop	human-in-the-loop

AnyLogic Personal Learning Edition [PERSONAL LEARNING USE ONLY]

The screenshot displays the AnyLogic software interface. On the left is the **Material Handling Library** with various components like Material Item Type, Transporter Type, Resource Type, and different types of conveyors and stations. The main workspace shows a 3D-style simulation of a conveyor belt system with a station labeled 'bussingStation'. Below the main view is a 2D schematic diagram showing a 'source' node connected to a 'convey' node, which is connected to a 'sink' node, with a 'bussingOperators' resource set below it. On the right is the **Properties** panel for the selected 'bussingStation - Station' object, containing settings for Name, Lock, Visible, Material Item Type, Delay type, Process time, Capacity, Processing, Loading, Resources, Use resources, Seize, Resource sets, Send seized resources, Customize resource choice, Task priority, Task may preempt, and Task preemption policy.

**Material Handling Library**

- Material Item Type
- Transporter Type
- Resource Type
- Space Markup
- Conveyor
- Conveyor Spur
- Position on Conveyor
- Transfer Table
- Turntable
- Turn Station
- Station
- Custom Station
- Job Crane
- Overhead Crane
- Storage
- Lift
- Path
- Rectangular Node
- Polygonal Node
- Point Node
- Attractor
- Wall
- Rectangular Wall
- Circular Wall
- Network Port
- Level Gate
- Density Map
- Blocks
- Convey
- Conveyor Enter
- Conveyor Exit
- Move By Crane
- Seize Crane
- Release Crane
- Transporter Fleet
- Move By Transporter

**Properties - bussingStation - Station**

- Name: bussingStation  Ignore  Visible on upper a
- Lock:
- Visible:  no
- Material Item Type:  Agent
- Delay type:  Specified time  Until stopProcess() is called
- Process time:  3
- Capacity:  1
- Processing:  starts when capacity is full
- Loading:  Starts when unloading completes  Simultaneous with unloading
- Resources
- Use resources:
- Seize:  (alternative) resource sets  units of the same pool
- Resource sets:  bussingOperators 1
- Send seized resources:
- Customize resource choice:
- Task priority:  0
- Task may preempt:
- Task preemption policy:  No preemption
- Actions

AnyLogic Personal Learning Edition [PERSONAL LEARNING USE ONLY]

The screenshot displays the AnyLogic software interface. The main workspace shows a 2D simulation environment with a grid. A blue bus route is visible, consisting of a horizontal line on the top and a vertical line on the right, connected by a 90-degree turn. A bus icon is positioned on the horizontal segment. A 'bussingStation' is located at the end of the horizontal segment. A 'source' node is connected to a 'sink' node via a 'recovery' node, with a 'sink' label below it. The 'Properties' panel on the right is open for the 'bussingStation - Station' object. The 'Resources' section is expanded, showing 'Use resources' checked, 'Seiz' set to '(alternative) resource sets', and 'Resource sets' containing 'bussingOperators' with a value of 1. The 'Problems' panel at the bottom left is empty, showing 'No problems'.

**Properties: bussingStation - Station**

- Name: bussingStation  ignore  Visible on upper agent
- Lock:  Lock
- Visible:  no
- Material item type:  Agent
- Delay type:  Specified time  Until stopProcess() is called
- Process time:  minutes
- Capacity:
- Processing:
- Loading:  Starts when unloading completes  Simultaneous with unloading

**Resources**

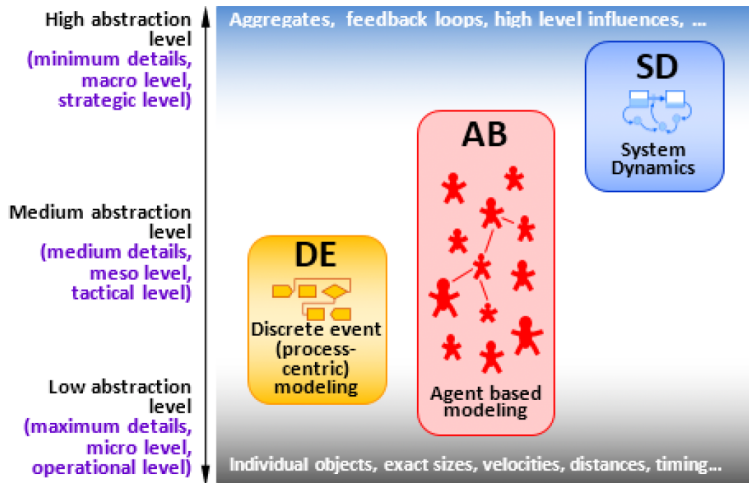

- Use resources:
- Seiz:  (alternative) resource sets  units of the same pool
- Resource sets:
- Send seized resources:
- Customize resource choice:
- Task priority:
- Task may preempt:
- Task preemption policy:

**Problems**

Description	Location
No problems	

Solar Panel Production      \*meters = 20px, X=155, Y=390

# Modeling Methods

Source: [AnyLogic Book](#)

# Modeling Libraries (Palette)

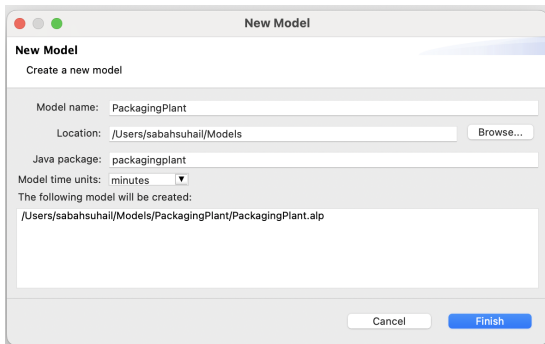

- Process Modeling Library
- Material Handling Library
- Space Markup
- Presentation
- StateChart
- Analysis
- Others

# Pre-requisites

- Study the underlying use case
- Define the objective(s)
- Select the modeling type (Agent-based, Discrete Event, System Dynamics, or Hybrid)
- Identify the critical component(s) to be modeled in the twin environment based on the objective

# Creating a Project

- File – > New – > Model
- Set Model time units now or later (Click on Project name, Model time units in Properties Tab)  
(By default in seconds)

Note: Go to the Main in the Project Tab (Graphical Editor)

# Setting Simulation Run time

How long should a simulation run?

- Go to → Simulation: Main (in Project tab)
  - Model time (Purpose: to define the duration of the simulation)
  - Change Never to Stop at specified date/time
  - Randomness:
    - Reproducing results: Use the same seed value to ensure consistent outcomes for debugging and verification.
    - Exploring different scenarios: Use different seed values to explore how randomness impacts variability and system behavior.

The screenshot displays the AnyLogic Personal Learning Edition (PERSONAL LEARNING USE ONLY) interface. The main window is titled 'PackagingPlant' and shows a simulation environment with a grid. On the right, the 'Properties - Simulation Experiment' panel is open, showing various configuration options:

- Name:** Simulation (checkbox 'Ignore' is unchecked)
- Top-level agent:** Main (dropdown menu)
- Minimum available memory:** 312 MB (dropdown menu)
- Stop experiment screen and run the model:** (checkbox checked)
- Model time:**
  - Execution mode:** Virtual time (as fast as possible) (checkbox checked)
  - Stop time with scale:** 0 (dropdown menu)
  - Stop:** Stop at specified date (dropdown menu)
  - Start time:** 0 (text input)
  - Step time:** 0.0100 (text input)
  - Start date:** 22. 4. 2020 (text input)
  - Stop date:** 22. 5. 2020 (text input)
  - Time:** 08:00:00 (text input)
  - Time:** 17:00:00 (text input)
- Randomness:**
  - Random number generation:**
    - Random seed (unique simulation runs):** (checkbox checked)
    - Fixed seed (reproducible simulation runs):** (checkbox checked)
    - Custom generator (subclass of Random):** java.RandInt() (text input)
    - Seed value:** 1 (text input)
- Windows:**
  - Title:** PackagingPlant - Simulation
  - Enable score and jarring:** (checkbox checked)
  - Enable developer panel:** (checkbox checked)
  - Show developer panel on start:** (checkbox unchecked)
  - Java options:** (checkbox unchecked)
  - Advanced Java:** (checkbox unchecked)
  - Advanced:** (checkbox unchecked)
  - Description:** (checkbox unchecked)

# Creating a Logical Model (1/4)

We will be using a combination of modeling libraries (Palette Tab),

## Process Modeling Library:

- Add a **Source** block (Purpose: Define the number of commodities arriving on the conveyor belt)
- Assign it a name—sourceBottle (Follow Java naming conventions, i.e., camelCase)
- Set Arrival rate— Inter-arrival time : exponential(1.0/10.0) (define a value or use a probabilistic function, i.e., exponential or uniform)
- First arrival occurs — After timeout
- Multiple agents per arrival check it and define Agents per arrival
- Check Properties Tab, Agent → New agent (will be updated later)

Setting parameters for a block depends on the scenario/objective.

## Creating a Logical Model (2/4)

- Add a **Queue** block (Purpose: Hold items until conveyor is ready or waiting for next operations)
- Assign it a name—queueBottle
- Set a reasonable capacity

Note: Some of the parameters, such as Agent location, are defined once we define agents. The Advanced tab under Properties also shows by default Agent Type as Agent

Check connectors of each block carefully

## Creating a Logical Model (3/4)

- Add a **Conveyor** block (Purpose: Conveyor belt)
- Assign it a name—conveyorBelt
- Set parameters—Length, Speed, Accumulating

Check connectors of each block carefully

## Creating a Logical Model (4/4)

- Add a **Sink** block (Purpose: To end the process.)

From Model drop-down menu: Build model and Run simulation (Check for shortcuts)

Check connectors of each block carefully

# Creating a Logical Model

## Logical Model in Graphical Editor

## Logical Model in Simulation Window

Start with a minimal model and add complexity step-by-step.

# Creating a 2D Model (1/2)

## Logical Model (Under-the-hood rules and processes) vs. 2D/3D Model (Visual representation)

- Use **Space Markup** modeling library to define simulation space.
  - Select `Rectangle` node, Assign it a name (`bottleArrivalArea`), Draw a rectangle on the graphical area
  - Select `Path`, Assign it a name (`conveyorPath`), Draw a line on the graphical area, In the Properties Tab: Appearance → select `Conveyor` from the drop-down.
- Optionally, import a drawing using `Image` element from `Presentation` library and overlay markup elements on image using `Space Markup` library.

## Creating a 2D Model (2/2)

- Map logical model to 2D model
  - Select queueBottle in the logical model and specify Agent location (bottleArrivalArea)
  - Select conveyorBelt in the logical model and specify Agent location (conveyorPath)
- Build model and Run simulation

# Creating an Agent

- Create Agent (Bottle) from Agent modeling library, Assign it a name, shape, etc. (Note: You may see the created agent in the Project Tab)
- Select sourceBottle in the logical model, go to Agent in Properties Tab, set New Agent as Agent Bottle

# Adding Other Events to Model

Add the following blocks to the logical model

- Assembler: Set Delay time
- Resource Pool: Set Capacity and add Resource sets to the assembler (which is Resource Pool), set new resource unit to Worker agent
- Create Agents (Worker and Packaging)

# Adding Charts

- Busy workers
- Available workers
